

Pathfinder 5

Contains 5% metaldehyde

Pathfinder 5 contains metaldehyde which is a specific molluscicide acting by irreversibly destroying the mucus producing cells of the slug causing death. This action is unaffected by ambient moisture conditions and slugs will not recover once the cells are destroyed. Metaldehyde acts specifically on slugs and therefore it has minimum effect when used as directed on non-target organisms such as:

- Earthworms
- Carabid Beetles
- Other soil fauna

Key Benefits

- For use on ALL edible and non edible crops
- Maximum Dose 18kg/ha
- 90 pellets/square metre at full rate
- Efficient control of ALL slug species
- Contains a bittering agent to deter mammal feeding
- Minimum effect on non target species

Summary of directions for use

1. **Timing:** Early applications of Pathfinder 5 are invariably more effective than late applications. Apply at drilling or at crop emergence where slugs are present. It is recommended to use traps to determine the risk of slug damage. More than 3 slugs per trap would indicate a significant risk and treatment would be advised.
2. **Rate:** Maximum individual dose is 18kg per hectare. Where slug populations are very high or where weather conditions remain favourable for slug activity over a long period subsequent applications may be required. In these circumstances two reduced rates of 7kg per hectare have shown to be effective.
3. **Crops:** All edible and non edible crops may be treated. In vegetable and fruit crops apply Pathfinder 5 as soon as evidence of damage is detected.

Pathfinder 5 is a high quality ready to use molluscicide bait formulated using quality wheat flour for effective control of slugs and snails.
